Introduction

Motivation

- P = set of n points in $\mathbb{R}^d$.
- $D = \{|pq| \mid p, q \in P\}$.
- $|D| = ?$
- Decomposition of $P \times P = \{A_i\}_i$ s.t. $P \times P = \cup_i A_i$,
 A_i = pairs with same distance.
- $|\{A_i\}_i| = |D| \in \Theta(n^2)$.
- What if A_i = pairs with **almost** same distance?
Is there a decomposition with size $o(n^2)$?
- Answer:

Question

Does a WSPD exist for any set P ?

Answer

Yes. We can consider WSPD for P as follows

$$\{\{p_i\}, \{q_i\}\} \quad \forall \text{ distinct points } p_i \text{ and } q_i \text{ of } P$$

Size: $\mathcal{O}(n^2)$.

WSPD of size $\mathcal{O}(n)$?

(Callahan & Kosaraju (1995))

For any set of n points, we can construct a WSPD of size $\mathcal{O}(s^d \cdot n)$ in $\mathcal{O}(n \log n)$ time using $\mathcal{O}(s^d \cdot n)$ space.

Computing WSPD

SSPD

Extension to Other
Metrics

Main Idea:

- Compute Partial Split Tree in $\mathcal{O}(n)$ time.
- Change the Partial Split Tree to Split Tree.

Partial Split Tree

- Same as Split Tree; but leaves can have size between 1 and $n/2$.
- Time needed in each node is proportional to the size of smaller child.
- In computation: recurse on bigger child if its size is $> n/2$.

The Split Tree

$\mathcal{O}(n \log n)$ Algorithm

Computing WSPD

Algorithm COMPUTEWSPD(T, s)

Input: T : Split Tree, $s > 0$.

Output: WSPD for S .

1. **for each** internal node u of T
2. $v :=$ left child of u ;
3. $w :=$ right child of u ;
4. FINDPAIRS(v, w);

The
Well-Separated
Pair
Decomposition

M. Farshi

Definition of

Compute WSPD

The Split Tree

Computing WSPD

SSPD

Extension to Other
Metrics

Algorithm FINDPAIRS(v, w)

1. **if** P_v and P_w are s -well-separated pair
2. **then** return the node pair $\{v, w\}$
3. **else if** $L_{max}(R(v)) \leq L_{max}(R(w))$
4. **then**
 5. $w_l :=$ left child of w ;
 6. $w_r :=$ right child of w ;
 7. FINDPAIRS(v, w_l);
 8. FINDPAIRS(v, w_r);
9. **else**
 10. $v_l :=$ left child of v ;
 11. $v_r :=$ right child of v ;
 12. FINDPAIRS(v_l, w);
 13. FINDPAIRS(v_r, w);

Bounding boxes is used to decide about the well-separatedness in $\mathcal{O}(1)$ time.

Main Idea:

- Make pairs directed.
 - (P_u, P_v) if $(P_{par(u)}, P_v)$ is not WSP.
 - (P_v, P_u) if $(P_u, P_{par(v)})$ is not WSP.
- Each node appears in constant directed pairs as first item (Using Packing Lemma).

Lemma

Let u be any node of the split tree T . There are at most $((2s + 4)\sqrt{d} + 4)^d$ nodes v in T such that (P_u, P_v) is a directed pair in the WSPD computed by algorithm $\text{COMPUTE WSPD}(T, s)$.

WSPD Theorem

Let $P \subset \mathbb{R}^d$ be a set of n points and $s > 0$.

- 1 The split tree for P can be computed in $\mathcal{O}(n \log n)$ time.
- 2 Given the split tree, we can compute in $\mathcal{O}(s^d n)$ time, a WSPD for P with respect to s of size $\mathcal{O}(s^d n)$.

Semi-Separated Pair Decomposition:

Just replace WS by SS in WSPD definition.

SSPD Construction:

For any set P an SSPD $\{(A_i, B_i)\}_{i=1}^m$ such that

- $m = \mathcal{O}(s^d \cdot n)$,
- $\sum_i (|A_i| + |B_i|) = \mathcal{O}(s^d \cdot n \log n)$.

can be constructed in near linear time and space.

Note: $\sum_i (|A_i| + |B_i|) = \Omega(n \log n)$.

- Proposed by Varadarajan (1998).
- Improved and applied to some problems by Abam *et al.* (2005&2008).
